Adenovirus, a nonenveloped animal virus that causes respiratory illnesses in humans, uses protein spikes protruding from its capsomeres to attach to the host cell. Nonenveloped viruses also include those that cause polio (poliovirus), plantar warts (papillomavirus), and hepatitis A (hepatitis A virus).

7. True or false: Once inside a T cell (or CD4 cell), HIV uses it as a virus-making factory to make copies of itself. The new viruses then leave the T cell and destroy other healthy T cells as they multiply inside the body. T cells invaded by HIV can no longer fight infections properly. 8.

Quiz Answer Key -

KidsHealth

It is not clear why the virus stops replicating within the nerve cells and expresses few viral proteins but, in some cases, typically after many years of dormancy, the virus is reactivated and causes a new disease called shingles (Figure 7).

Whereas chickenpox affects many areas throughout the body, shingles is a nerve cell-

A virus cannot be killed by antibiotics because antibiotics are used to kill living organisms.

Viruses are not “living.” The strongest defense against a virus is the body’s own immune system which will attack the virus. Recent studies have shown that light can also kill a virus so in some cases, lasers are being used to kill viruses.
