### Allocation Of Transmission Fixed Charges

Allocation of transmission fixed charges: an overview Abstract: The application of marginal cost in pricing the transmission services has shown not effective mainly due to revenue reconciliation problems.

ALLOCATION OF TRANSMISSION FIXED CHARGES: AN OVERVIEW - Power Systems, IEEE Transactions on 1416 odrigo Palma (Universidad Cat6lica de Chile, Santiago, Chile). The author is to be congratulated on his efforts to develop procedures to assess different transmission cost allocation methods.

### ALLOCATION OF TRANSMISSION FIXED CHARGES: AN OVERVIEW ...

Each participant should pay fixed charges in proportion to ownership which, in turn, should be proportional to benefits received. It is the purpose of this thesis to introduce an equitable way to allocate fixed costs of a transmission line based on benefits received. It is presumed in this thesis that benefits of transmission lines

This paper presents a new method to allocate the transmission cost among generators and loads. The allocation is calculated for each transmission line through the identification and quantification of a fair distribution of both generators and loads. This method is based on circuit theory using modified impedance matrix.

The ISO's responsibilities as Regional Transmission Organization include Transmission Cost Allocation (TCA). That means deciding who pays for regulated (not merchant) transmission projects, in a collaborative and transparent process, as follows: Transmission owners (TOs) submit a TCA application for projects that qualify for regional rate recovery.

### Transmission Cost Allocation - ISO New England

The Transmission Enhancement charge compensates the transmission owners responsible for developing these projects. The costs of these projects are allocated across the zones based on a net benefit analysis by PJM. These charges can result in a credit if the transmission owner includes these costs in their NITS rates such as with PSEG.

### Understanding Transmission Costs in Your Power Bill ...

Perhaps the most contentious electricity transmission financing issue is cost allocation for new interstate transmission lines—that is, deciding which electricity customers pay how much of the cost of building and operating a new transmission line that crosses several states.

## **Electricity Transmission Cost Allocation**

Transmission cost allocation is commonly cited as a key issue in determining whether new transmission is built or not. Transmission cost allocation can be particularly contentious for multi-state transmission projects that cross more than one state, as the benefits of the proposed project may accrue unevenly to market participants.

To recover the total fixed transmission costs, distribution factors can be used to allocate transmission payments to different users. By using these factors, allocation can be attributed to transaction-related net power injections, to generators, or to loads. The distribution factors are given as follows:

For example, a fixed monthly fee would have less impact on short-run behavior, compared with a volumetric (per MWh) charge. For purposes of recovering sunk transmission costs, the method that is least likely to induce inefficient behavior would be a fixed charge that is only loosely calibrated to the usage of a customer.

A big portion of any transmission replacement or rebuild is the labor cost. It's at least six hours to remove and install a transmission, often twice that. How much is a transmission? Well, transmission prices will vary between different makes and models, but can range from \$1500 to \$4000 for the part alone! When you're looking at the true ...

Actual transmission pricing schemes set rates well above marginal cost to recover the fixed costs of the transmission system as well. The methodology used to recover fixed costs (in excess of marginal costs) can change the allocation of costs among different types of generation.
