EIGRP Terminology and Operation. EIGRP sends out five different types of packets—hello, update, query, reply, and acknowledge (ACK)—that are used to establish the initial adjacency between neighbors and to keep the topology and routing tables current. When troubleshooting an EIGRP network, network administrators must understand what EIGRP packets are used for and how they are exchanged.

Enhanced Interior Gateway Routing Protocol (EIGRP) is an interior gateway protocol suited for many different topologies and media. In a well designed network, EIGRP scales well and provides extremely quick convergence times with minimal network traffic. EIGRP Theory of Operation. Some of the many advantages of EIGRP are:

Enhanced Interior Gateway Routing Protocol - Cisco

Bipin Enhanced Interior Gateway Routing Protocol (EIGRP) is an advanced dynamic routing protocol that is used for routing decisions and configuration on the routers. EIGRP was developed by Cisco Systems as a proprietary protocol, which can be used only on Cisco routers but in 2013 partial functionality of EIGRP was converted to an open standard.

EIGRP can be used not only for Internet Protocol (IP) networks but also for AppleTalk and Novell NetWare networks. Using EIGRP, a router keeps a copy of its neighbor's routing tables. If it can't find a route to a destination in one of these tables, it queries its neighbors for a route and they in turn query their neighbors until a route is found.
