Foundation Design This website is designed to provide geotechnical engineers and home owners with simple models/tools for designing different types of foundations. You can even generate your own web-based apps/models using simple Python code as a registered developer. This website is a community effort.

Foundation engineering applies the knowledge of soil mechanics, rock mechanics, geology, and structural engineering to the design and construction of foundations for buildings and other structures. The most basic aspect of foundation engineering deals with the selection of the type of foundation, such as using a shallow or deep foundation system.

We complement skills in traditional geotechnical engineering practices with state-of-the-art geotechnical investigation testing methods, which are particularly valuable where soils are less than ideal for foundation conditions. These testing methods help identify and optimize foundation design options to limit construction costs.

Geotechnical engineers and engineering geologists perform geotechnical investigations to obtain information on the physical properties of soil and rock underlying (and sometimes adjacent to) a site to design earthworks and foundations for proposed structures, and for the repair of distress to earthworks and structures caused by subsurface conditions.

Foundation design is required for all structures to ensure that the loads imposed on the underlying soil will not cause shear failures or damaging settlements. The two major types of foundations used for transportation structures can be categorized as "shallow" and "deep" foundations.

**Geotechnical Engineering: Shallow Foundations**  
Depending on site conditions and structure demand, Kleinfelder can develop efficient foundation designs comprised of shallow (spread footings, mats), intermediate (ground improvement methods), or deep foundations (piles, drilled shafts, auger cast).

EEI's Geotechnical Design Division routinely develops foundation recommendations for commercial, industrial, and residential buildings to support subsurface investigations. We develop shallow foundation recommendations for spread footings and mat foundations whenever possible to provide cost-effective solutions for clients.

Geotechnical Engineering is at the foundation of every structure and project. What do we do? We evaluate stability of natural slopes and man-made soil deposits; assess risks posed by site conditions. We understand soil mechanics and rock mechanics, and many of the aspects of geology, geophysics, hydrology, and other related sciences.

Foundation Design Requirements The foundation, including the underlying soil and rock, must be safe against a structural failure that could result in collapse. For example, the foundation for a skyscraper must support the great weight of the building above on a relatively narrow base without danger of overturning.
