Hydraulic-Training Axial Piston Units Basic Principles

Description The axial piston units of swashplate design, with fixed or variable displacement, can operate as hydraulic pumps or motors. When used as a pump, the flow is proportional to the input speed and the swashplate angle. If the unit is used as a motor, the output speed is proportional to the flow through the unit.

Axial piston pumps are widely used throughout the mobile and industrial sectors. They are generally the pump of choice for flows over 5L/min and up to 415 bar, if budgets allow. In general, the swash plate design is used for pumps and the bent axis design for motors although there are applications where this is not the best solution.

Hydraulic Pump/Motor Division In this view the variable orifice is restricting pump flow . Pump outlet pressure is increased and a pressure drop is created across the orifice. The pump pressure will increase until it overcomes the differential spring force and shifts the spool to direct control oil into the servo piston and destroke the pump. The

TRAINING Hydraulic Axial Piston Pumps. Theory of Operation by Delta Q Axial Piston Pumps are highly efficient pumping units capable of high pressures and flows. An axial piston pump with load sense offers flow on demand and with a closed center control valve, little heat is generated when the pump is destrokeed because no fluid is moved.

Axial piston pumps have a circular piston group which rotates against an angled swash plate. As the rotary group turns the pistons are pushed forwards and backwards. A grooved timing plate at the at the top of the pistons controls the way the fluid is drawn through the suction side of the pump and out through the pressure side.

Axial-piston motors also use the reciprocating piston motion principle to rotate the output shaft, but motion is axial, rather than radial. Their efficiency characteristics are similar to those of radial-piston motors. Initially, axial-piston motors cost more than vane or gear motors of comparable horsepower.
