An approach to counteract this is to start with a huge number of hidden layers + hidden neurons and then use dropout and early stopping to let the neural network size itself down for you. Again, I'd recommend trying a few combinations and track the performance in your Weights and Biases dashboard to determine the perfect network size for your problem.

Monday, 10 August 2015 Artificial neural networks are statistical learning models, inspired by biological neural networks (central nervous systems, such as the brain), that are used in machine learning. These networks are represented as systems of interconnected "neurons", which send messages to each other.

A recurrent neural network for solving linear programming problems was developed based on the design proposed in Wang. The network takes a linear programming problem and transforms it into a primal-dual problem. A recurrent neural network is constructed based on the primal-dual problem whose stable state is a feasible solution to the primal-dual problem.
